

TM ONE Managed Security Operations Centre

TM ONE Managed SOC Services is a Solution or Services that provides real-time analysis of security alerts generated by security devices, network hardware and appliances. Managed SOC also compliments all TM ONE Cyber Security Services products. The underlying principle – Security Information & Event Management (SIEM) system is to collect security log events from numerous hosts within an enterprise and store its data centrally.

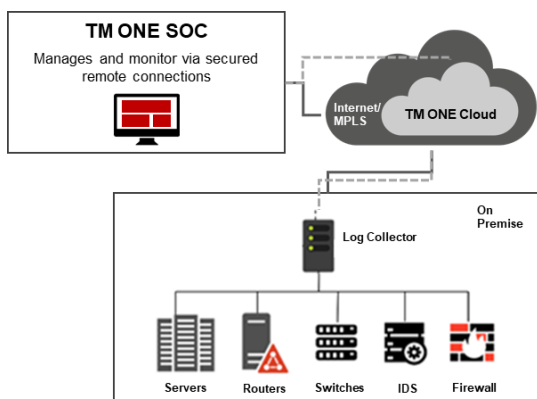

How Managed SOC Works?

SIEM provides a solid foundation for an organisation’s security operations centre by providing a centralised user interface that offers role-based access by function and a global view to access real-time analysis, incident management and reporting.

- **On Premise:** Data resides in your premises appliance where SOC remotely monitors and configures. The appliance consists of 3 main components; console, SIEM engine and log collector.
- **Cloud Surveillance:** Deploying log collector at your premises. SOC will remotely monitor via cloud. This also enables the ability to perform multi tenancy.

How Managed SOC Provides Value to You?

- Delivers 24/7 proactive and centralised monitoring and security-related management with high availability SOC across multiple sites
- Analytics capabilities/Threat intelligence
- Advanced monthly reporting functionality i.e flexible threat analysis, daily log analysis, etc.
- Certified Security Analyst of well-known IT Security certification
- ISO27001 Certified SOC
- Industry standard vulnerability assessment
- Client Security Portal – full visibility of security and compliance posture
- Service Asset & Configuration Management, Change Management and Release & Deployment Management
- Empowers asset management and IT hygiene

Features:

- Log Analysis
- Log Data Retention
- Event Correlation
- IT Compliant
- User Monitoring
- Dashboards
- Reporting
